                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               122
/clone_lib="UI-E-EOO"
/note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I; UI-E-EOO is a cDNA library containing the following tissue(s): fetal eye. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          <http://www.invitrogen.com/>). The library code
designation was cs. For this library, cDNA inserts were
cloned into the NotI/MluI sites of the vector. EST
analysis was performed on the unamplified library at the
NIH Intramural Sequencing Center (NISC)."

                 /clome lib="Human Retinal pigment epithelium/choroid cDNA (Un-normalized, unamplified): cs" (rs" of inferent donor /note="forgan: Eye, Vector: pcMvSpQRT6; Two different donor eyes (75-80 years old) yielded approximately 600 mg of dissected RPE/choroid tissue. This in turn yielded 340 ug of total RNA and 7 ug of mRNA. A directionally cloned cDNA of total RNA and 7 ug of mRNA. A directionally cloned cDNA library in the pcMvSpQRT6 vector was constructed at Life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CGCGTATACC. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

/note="Organ: Eye; Vector: pcMvSpORT6; Two different donor eyes (75-80 years old) yielded approximately 600 mg of dissected RPE/choroid tissue. This in turn yielded 340 ug of total RNA and 7 ug of mRNA. A directionally cloned cDNA library in the pcMvSpORT6 vector was constructed at Life Technologies (Rockville, MD; now part of Invitrogen Corp), essentially following the protocols of the SuperScript Plasmid System (Invitrogen Corp. <a href="http://www.invitrogen.com/">http://www.invitrogen.com/</a>). The library code designation was cs. For this library, cDNA inserts were cloned into the NotI/Mul sites of the vector. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                graeme@helix.nih.gov

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        is substituted: Lys-Thr-Trp-Gly-Gln-Tyr-Trp-Gln-Val. Vaccines comprising the peptide, an epitope of the peptide, nucleotide sequence encoding the peptide, or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive tumour infiltrating lymphocytes, which can also be used in vaccines. The peptides can be exploited to elicit native epitope-reactive CTL. Usage of the peptides with improved immunogenicity may contribute to the development of CTL-epitope based vaccines in viral disease and cancer.
                            or prevention (by immunization) of melanoma. Antibodies again and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is

                                                                                                                   This sequence represents a specifically claimed example of a novel peptide, which is immunogenic with lymphocytes directed against metastatic melanomas. It is characterised in that it comprises at least a part of the following sequence, where the amino acid at position 2 or 8 is substituted: Lys-Thr-Trp-Gly-Gln-Tyr-Trp-Gln-Val. Vaccines comprising the peptide, an epitope of the peptide, nucleotide sequence encoding the peptide, or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive tumour infiltrating lymphocytes, which can also be used in vaccines. The peptides can be exploited to elicit native epitope-reactive CTL. Usage of the peptides with improved immunogenicity may contribute to the development of CTL-epitope based vaccines in viral disease and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ARR84783-800 are G9-154 peptides modified to improve immunogenicity. G9-154 is an immunogenic peptide based on the melanoma antigen (MART-1) (see ARR84208). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1

This sequence represents a specifically claimed example of a novel peptide, which is immunogenic with lymphocytes directed against metastatic melanomas. It is characterised in that it comprises at least a part of the following sequence, where the amino acid at position 2 or 8 is substituted: Lys-Thr-Trp-Gly-Gln-Tyr-Trp-Gln-Val. Vaccines comprising the peptide, an epitope of the peptide, nucleotide sequence encoding the peptide, or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive cumour infiltrating lymphocytes, which can also be used in vaccines. The peptides can be exploited to elicit native epitope-reactive CTL. Usage of the peptides with improved immunogenicity may contribute to the development of CTL-epitope based vaccines in viral disease and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          vectors, immunise

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAR84783-800 are G9-154 peptides modified to improve immunogenicity. G9-154 is an immunogenic peptide based on the melanoma antigen (MART-1) (see AAR84208). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (ALKU ) AKZO NOBEL NV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           _

                                                                                                                           metastatic melanomas. They are characterised in that they comprise at least a part of the following sequence, where the amino acid at position 2 or 8 is substituted: Lys-Thr-Try-Gly-Gln-Tyr-Try-Gln-Val. Vaccines comprising the peptide, an epitope of the peptide, nucleotide sequence encoding the peptide or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive tumour infiltrating lymphocytes, which can also be used in vaccines. The peptides can be exploited to elicit native epitope-reactive to the development of CTL-epitope based vaccines in viral disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

The peptide sequence contains at least one amino acid modification of MART-1. The peptide is used in diagnostic and therapeutic methods as an immunoger vaccine to prevent or treat melanoma, and for in vivo tumour recognition and rejection. AAUZ8888-AAUZ9008 represent MART-1 peptide amino acid sequences, and related sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel immunogenic peptide comprising contiguous amino acids of new melanoma antigen recognised by T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunogenic peptide of melanoma associated antigen gp100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunogenic peptide useful in vaccines comprises specific amino acids of new melanoma antigen recognised by T lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5; Column 54; 73pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         standard; Protein; 9 AA

                                                                                                                                 The peptide epitope AAW77119-W77138 were created for human tumour-specific cytotoxic T lymphocyte response. These peptides are are cysteine- depleted mutants of a native disease-specific CTL epitope. The cysteine- depleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (See AAR78639-45) may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be us as primers and probes in the detection of melanoma cells. Tumous infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melan particles, and when radiolabelled, they may be used to identify
                                                                               cross-reactive epitope.
                                                                                            response than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different
                                                                                                                                                                                                                 Disclosure; Page 27; 93pp; English.

                                                                                            CC microparticle preparation (MP) has been developed, consisting of CC microparticles having a diameter of less than 100 mu m. The MP CC comprises: (a) a polymeric matrix (PM) consisting of one or more CC comprises: (a) a polymeric matrix (PM) consisting of one or more CC (b) an expression vector selected from RNA molecules (at least 50% of CC which are closed circles) or circular plasmid DNA (at least 50% of which are closed circles) or circular plasmid DNA (at least 50% of which are suppreceded). Also described is a MP of at most 20 microns in CC diameter, comprising: (a) a PM; and (b) a NAM comprising an expression CC control sequence operatively linked to a coding sequence, where the CC coding sequence encodes an expression product selected from: (l) a CC polypeptide at least 7 amino acids in length, having a sequence identical to the sequence of: (l) a fragment of a naturally-occurring mammalian CC to the sequence of: (i) a fragment of a naturally-occurring protein from an CC infectious agent which infects a mammal; (2) a peptide having a length CC and (3) the polypeptide or the peptide linked to a trafficking sequence. AAM69763 to AAW69765, and AAW78793 to AAW78897 are peptide fragments for the delivery of foolympials into the present invention. The MPS are highly effective vehicles for the delivery of foolympials into the present invention. The MPS are highly effective vehicles for the delivery of foolympials into the present invention.

                                                                                                                                                                                                                                                                                                                                 vitro. The method comprises contacting immunogenic peptides from an C antigen that binds class I major histocompatibility complex (MHC) C molecules with antigen presenting cells (APCs) pretreated with CC pretreatment growth factors, and incubating the APCs with purified CD8 CC cells in the presence of at least 2 incubation growth factors, thereby CC producing antigen-specific CTLs. A method for specifically killing CC target cells in a human patient is also provided which comprises CC obtaining a fluid sample containing CTLs from a patient, contacting the CC target cells with APCs pretreated with pre-treatment growth CC factors, where the APCs comprise class I MHC molecules. The pretreated CC APCs are incubated with the cytotoxic growth a carrier to form a composition. CC The composition can then be administered to the patient. The activated CTLs can be used for treating cancers, immune disorders, viral confictions, ANDS, hepatitis, bacterial infection, fungal infection,

Uptake of agonist mannosylated peptides will increase the T cell response, whereas uptake of antagonist peptides blocks the T cell response. Blocking binding of immunogenic autoantigens can be used in treatment of type I diabetes, rheumatoid arrthritis, graft rejection etc., also to induce T-cell non-

They are characterised in that they comprise at least a part of the following sequence, where the amino acid at position 2 or 8 is substituted: Lys-Thr-Trp-Gly-Gln-Tyr-Trp-Gln-Val. Vaccines comprising the peptide, an epitope of the peptide, nucleotide sequence encoding the peptide, or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive tumour infiltrating lymphocytes, which can also be used in vaccines. The peptides can be exploited to elicit native epitope-reactive to the development of CTL-epitope based vaccines in viral disease and

Vaccines comprising the peptide, an epitope of the peptide, nucleotide sequence encoding the peptide, or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive tumour infiltrating lymphocytes, which can also be used in vaccines. The peptides can be exploited to elicit native epitope-reactive CTL. Usage of the peptides with improved immunogenicity may contribute to the development of CTL-epitope based vaccines in viral disease and cancer.

Compositions containing autologous cytolytic T cells (CTL), specific for the HLA/(I) complex, are similarly useful, also transformed cells that stimulate such CTL in vivo. (II) are also used: (i) as source of therapeutic antisense sequences that reduce expression of (II); (iii) for recombinant production of (I); (iii) particularly its fragments, as primers and probes in usual hybridisation and amplification assays, for diagnosis, prognosis and monitoring of tumours, or for measuring binding specificity of HLA molecules or CTL clones; (iv) to identify related sequences; and (v) for generating transgenic animals, e.g. for studying cancer and immune responses to it. (I) are used to raise specific antibodies (Ab) and therapeutically. Ab are used to diagnose tumours in immunoassays. also for delivering dranes, toxing immaria accorte are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lipopeptide; epitope; cytotoxic T lymphocyte; CTL; lipid; spacer; electrical charge; hydrophilicity; vaccine; immune response; HIV; human immunodeficiency virus; hepatitis B virus; papilloma virus;

AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically tutreat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               epitope and at least one lipid residue with (i) the epitopes and lipid portion and (ii) the epitopes, being separated independently by peptide spacers. These spacers comprise sequences of amino acids which carry an overall electrical charge in neutral media to ensure that the lipopeptide is hydrophilic. The peptides AAY53301-Y53549 represents examples of peptide epitopes used to generate the lipopeptides. These ar used in therapeutic or prophylactic compositions and vaccines to induce specific immune responses against human immunodeficiency, hepatitis B or papilloma viruses; p53 of melanoma or the malaria parasite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma; vaccine; immunisation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
        expression vector (EVI) for delivering a heterologous protein into a eukaryotic cell, comprising in the 5'-3' direction; (3) a Yersinia or mutant Yersinia strain for delivering a heterologous protein into a eukaryotic cell, comprising contacting the terologous protein into a eukaryotic cell, comprising contacting the cell with a Y1 transformed with the above vector (Y1-EV1); (4) a method for delivering a heterologous protein into a eukaryotic cell, comprising contacting the cell with a Y1 transformed with the above vector (Y1-EV1); (5) a method for inducing an immune response specific for a heterologous protein; (6) a method for inducing a cytotoxic T-lymphocyte (CTL) response specific for a heterologous protein; (7) a method for determining the efficacy of an antigen vaccination regimen in a subject. Y1 is used to treat a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                               This invention describes a novel mutant Yersinia (Y1) strain, computation(s) in effector-encoding gene(s) and deficient in the proc of functional effector protein(s). The invention describes (1) a quintuple mutant Yersinia strain, having the designation Yersinia enterocolitica yopEHOMP or Yersinia pseudotuberculosis yopEHAOJ;
                                                                                                                                                                                                                                                                                                                                                                                                      Van

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                               lipopeptide that has a peptide part derived from mammalian interferon gamma (IFNg) and one or more lipophilic parts comprising a linear or branched, (un) saturated 4-20C hydrocarbyl chain or a steroid. The lipopeptide mimics the activity of IFNg. Compositions comprising the lipopeptide are used to treat or prevent any condition that responds to IFNg, and as adjuvant for vaccines (particularly those directed against tumors, viral or parasitic infections), to stimulate or (re)orient the immune response between types 1 and 2 cytokine profiles. Particular applications are treatment of infections (particularly viral, e.g. acquired immune deficiency syndrome, papilloma (cancer) and hepatitis, but also bacterial, fungal; parasitic or helminth); cancers (particularly of kidney, cutaneous T cells or ovary, chronic myelogenous leukemia or mesothelioma), allergy; and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                         B epitopes recognized by corresponding antibodies. The epitopes may be used in the composition of the invention. The specification describes lipopeptide that has a peptide part derived from mammalian interferon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CD4+ epitope; B epitope; lipopeptide; interferon gamma; adjuvant; vaccine; tumor; infection; immune response; cytokine profile; acquired immune deficiency syndrome; papilloma; cancer; hepatitis; autoimmune disease.

                                                                                                                       The invention relates to the generation of mixed micelles or microaggregates for inducing an immune response comprise: (a) a first lipopeptide comprising at least one TIL (cytotoxic T-lymphocyte) epitope and at least one lipid unit; and (b) a second lipopeptide comprising at least one HTL (helper T-lymphocyte) epitope and at least one lipid unit different from that of the first lipopeptide. This peptide represents an example of a lipopeptide epitope used in the invention and is derived from a human melanoma protein. The immunogenic lipopeptide micelles are used in vaccines, especially against HIV, hepatitis B virus (HBV), papilloma viruses, p53, melanoma or Plasmodium falciparum malaria.

The specification describes a MAGE-3 tumour associated gene. Peptides (AAY01721-25) that bind human leucocyte antigen (HLA) Class II molecules can be derived from the MAGE-3 protein. These peptides and autologous CD4+ cells that bind to a complex of MAGE-3 peptide and HLA Class II, are used to treat MAGE-3 related diseases, particularly cancers (e.g. melanoma, osteosarcoma, leukemia and various forms of carcinoma). The peptides are also used to produce specific antibodies. Detection of of the peptides, e.g. in binding assays, particularly with antibodies, is used for diagnosis of such
Tumour antigen; booster peptide; immune response modulation; allergy; immune response enhancer; tumour cell; tumour rejection antigen; leukocyte antigen-presenting molecule; autoimmune disease; allograft rejection.

The method is for for modulating an cimmune response in a mammal against an antigen, and comprises:

(A) inducing an immune response by: (i) administering a virus containing a nucleic acid molecule encoding the antigen or its precursor to generate an immune response; and (ii) administering at least one booster dose comprising a peptide including the antigen, in an adjuvant, in a combined amount effective to enhance the initial immune response; or (B) reducing an immune response as defined for (A) but using a combined comprising a peptide which includes the antigen, in an amount effective to reduce the initial immune response. Method (A) is used to enhance the immune response against tumour cells expressing tumour rejection antigens, and against pathogens in subjects having human cleukoyte antigens, and against pathogens in subjects having human esponse in allergy, autoimmune disease, and allograft rejection. Method (A) provides an immunisation method which, unlike prior art, is
                                                                                                                                               Query Match
